### The use of electric horizontal directional drills for sea-to-land shore approaches in the Baltic Sea

Energy transformation is not only about electric cars or electrically powered construction machinery and equipment, but also about offshore wind energy. The presentation will focus on the completed Baltic Power project, which involved the installation of four crossings with PEHD pipes of 710 mm diameter and lengths up to 1420 meters, as well as the ongoing Baltica 2 project, which includes four crossings with PEHD pipes of 800 mm diameter and lengths over 1200 meters each.

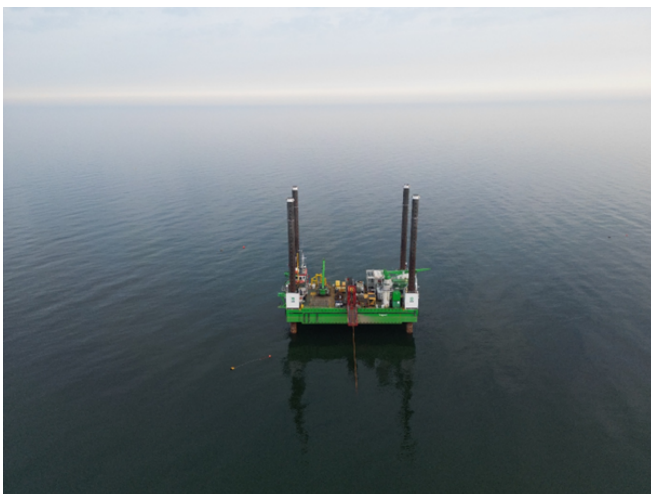

Jacek Janicki, co-owner of ZRB Janicki and technical director, with experience gained from numerous demanding constructions ranging from small crossings to mega trenchless projects, shares his knowledge as an academic lecturer, enhancing the qualifications of both contractors and investors.
